

Top Flap Bags

A "FIBC flap bag" refers to a flexible intermediate bulk container (FIBC) - essentially a large, woven bag used for bulk material storage and transport - that has a flap design on its top or bottom opening, allowing for easy access to load and unload materials while also providing protection against contamination or damage during handling and storage; the flap is typically made from the same woven polypropylene material as the bag itself and is attached to one side, enabling it to be opened and closed as needed.

Key points about FIBC flap bags:

Function:

The flap design allows for convenient access to the bag's contents while preventing spills and contamination from outside elements.

Material:

Usually made from woven polypropylene, which is durable and flexible.

Application:

Used in various industries like chemical, construction, agriculture, and food processing where bulk materials need to be stored and transported safely.
